

Geology & Groundwater of Saipan

August 5, 2009

CNMI Division of Environmental Quality

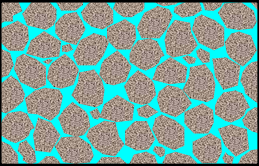

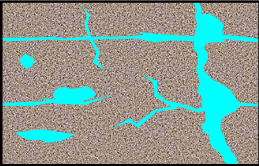

Geology & Groundwater

TOPICS:

- What is Groundwater?
- Saipan Geology
- Where do you find groundwater?
- Wells
- Contamination

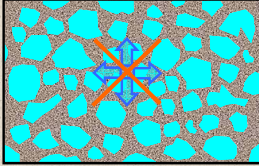

CNMI Division of Environmental Quality, 2009

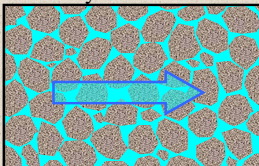

Groundwater:

- How can water exist in rock????
- Porosity:
- Primary porosity
 - Function of rock's primary structure (granular, crystalline, platey, etc.)
- Secondary porosity
 - Fractures
 - Solution channels
 - Voids, caverns, vugs

CNMI Division of Environmental Quality, 2009

Porosity = 40%

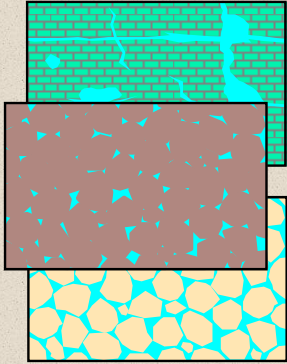

Porosity = 15%

Groundwater:

- How does water flow through rock????
- Permeability
- Porosity does not equal Permeability!!!
- Permeability = "Connected porosity"

CNMI Division of Environmental Quality, 2009

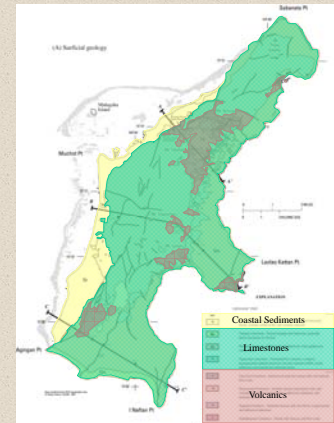

Permeability:

Dependent on the type of rock:

- Limestone
 - Very high permeability:
 - 'Thousands' ft/day
- Coastal sediments
 - Sands are permeable
- Volcanics
 - Essentially not permeable: "impermeable"

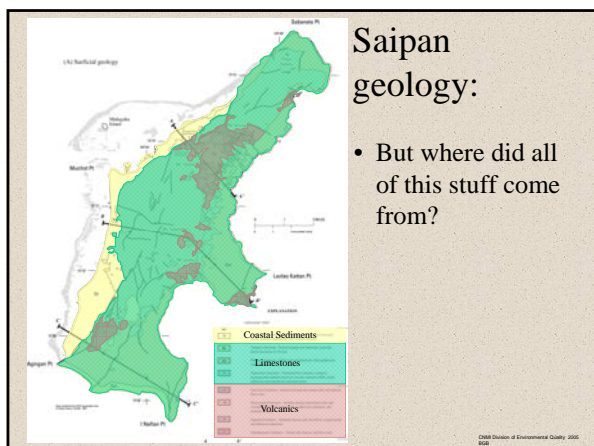

CNMI Division of Environmental Quality, 2009

Saipan geology:

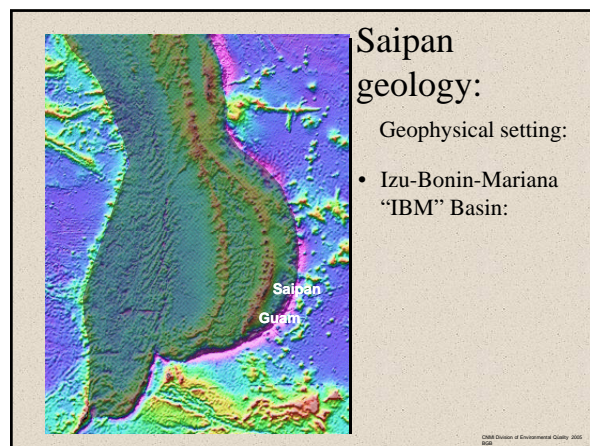

- Limestones
- volcanics
- Coastal sediments

CNMI Division of Environmental Quality, 2009

Saipan geology:

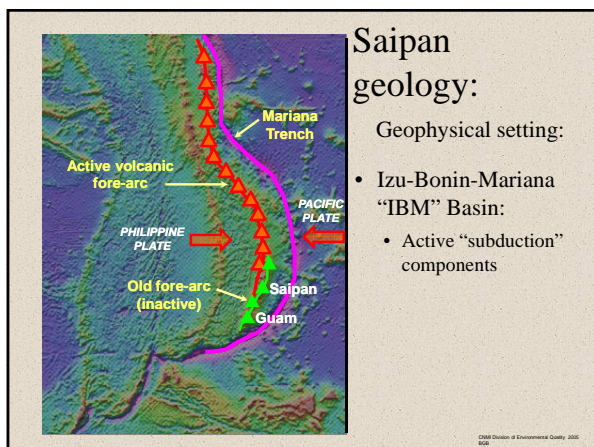

- But where did all of this stuff come from?

Saipan geology:

Geophysical setting:

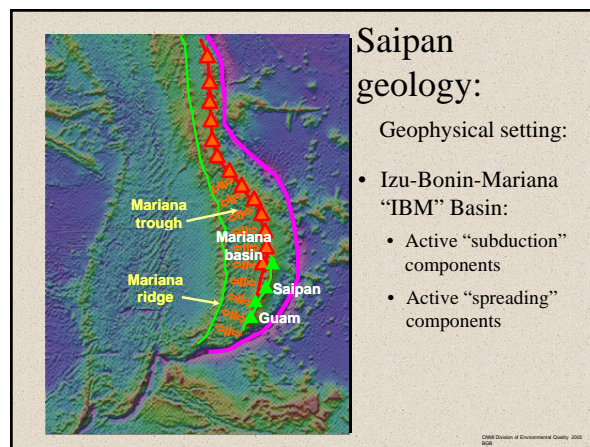

- Izu-Bonin-Mariana "IBM" Basin:

Saipan geology:

Geophysical setting:

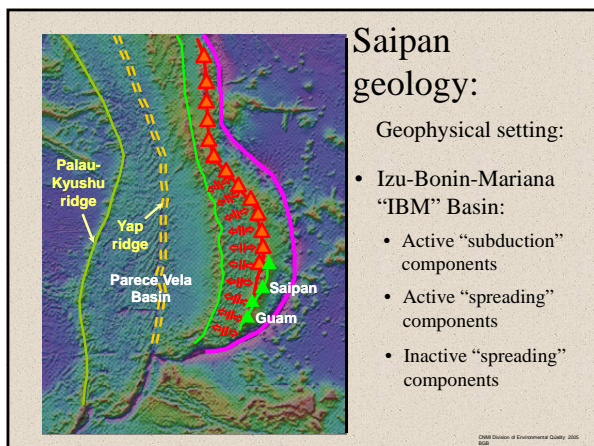

- Izu-Bonin-Mariana "IBM" Basin:
- Active "subduction" components

Saipan geology:

Geophysical setting:

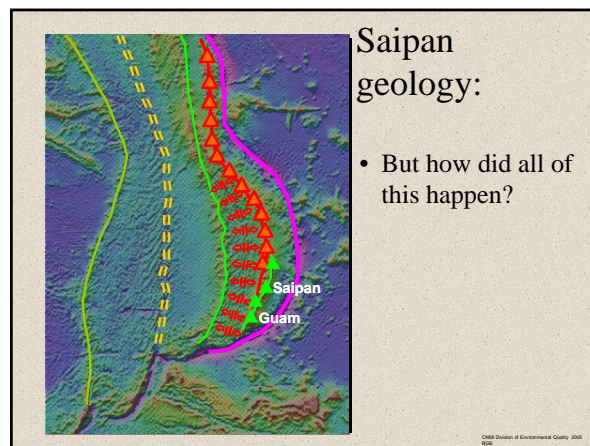

- Izu-Bonin-Mariana "IBM" Basin:
- Active "subduction" components
- Active "spreading" components

Saipan geology:

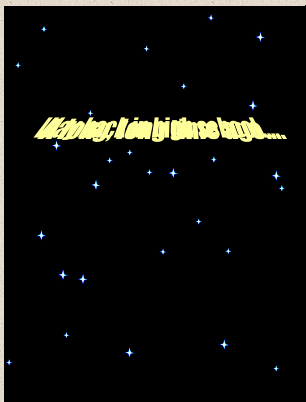

Geophysical setting:

- Izu-Bonin-Mariana "IBM" Basin:
- Active "subduction" components
- Active "spreading" components
- Inactive "spreading" components

Saipan geology:

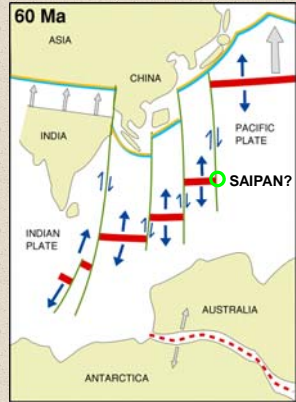

- But how did all of this happen?

Saipan geology:

- Do you remember learning about...

DMR Division of Environmental Quality 2005 8/22

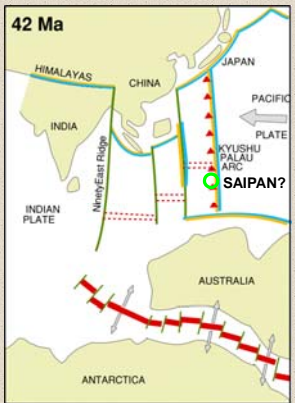

Saipan geology:

- Plate Tectonics?
- 60 Million ago ("Ma"); there is no Saipan
- India and Australia are about to change everything

Source: <http://www.le.ac.uk/geology/ani/2009/lecture5/lecture5.html>

DMR Division of Environmental Quality 2005 8/22

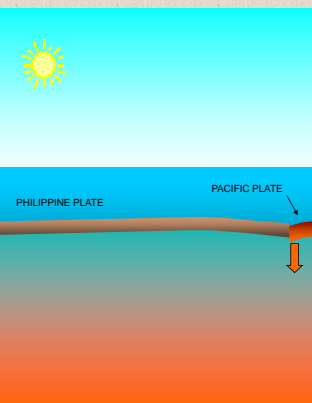

Saipan geology:

- Plate Tectonics:
- Pacific plate is forced to change direction; butts up against Philippine plate
- Still no Saipan

Source: <http://www.le.ac.uk/geology/ani/2009/lecture5/lecture5.html>

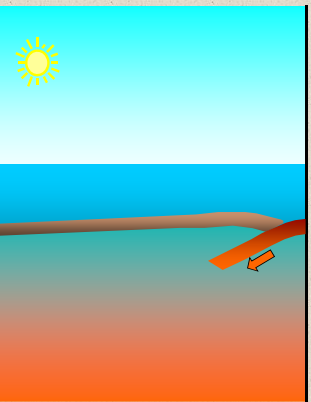

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Pacific plate begins to subduct about 50 million years ago - "Ma"

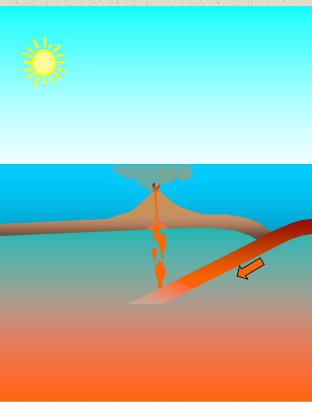

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Pacific plate begins "subduction" beneath Philippine plate ~43 Ma

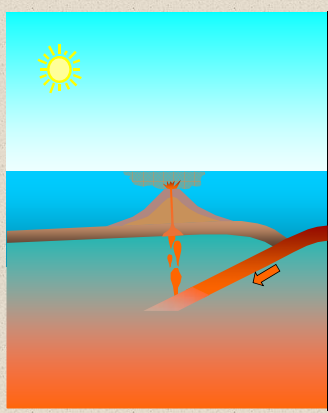

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Subducting plate heats and forms magma
- Saipan forms from initial volcanism: ~ 41 million years ago - "Ma"
- (Sankakuyama formation - 41 Ma)

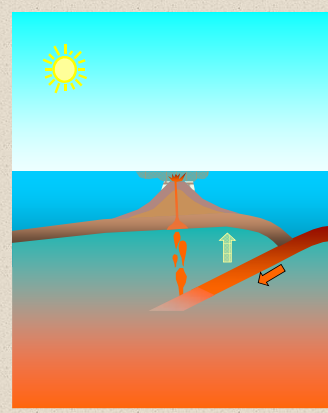

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Volcanism continues up to about 30 Ma
- During this period, island breaks surface and erodes/subsides several times

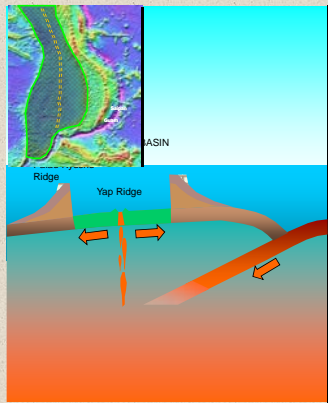

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Volcanism continues up to about 30 Ma
- During this period, island breaks surface and erodes/subsides several times
- "Uplifting" begins
- Marine sediments/reef building begins

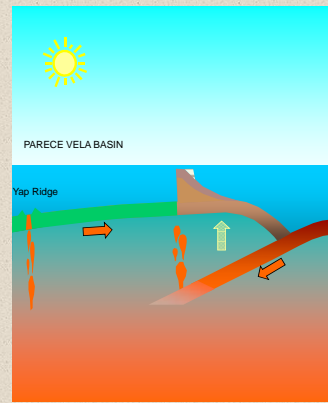

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- "Rifting" occurs at ~30 Mybp
- "Back-Arc Spreading" continues to ~15 Mybp; forming Parece Vela Basin
- Volcanism disrupted by rifting

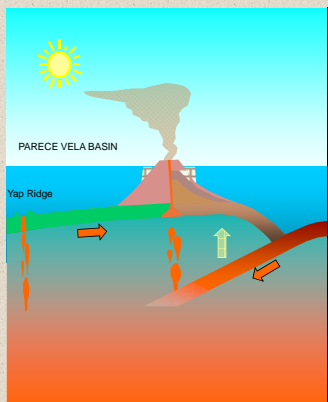

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- "Rifting" occurs at ~30 Mybp
- "Back-Arc Spreading" continues to ~15 Mybp; forming Parece Vela Basin
- Volcanism disrupted by rifting
- "Uplifting" is enhanced by spreading

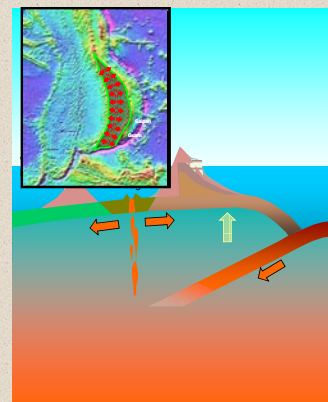

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Volcanism resumes along "Fore-Arc Axis" around 20 Ma:
 - "Magmatic maximum" ~ 13 Ma
 - Hagman, Deninsiyama, & Fina-Sisu formations
 - Complex layers of eroded volcanics, marine sediments

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Rifting occurs again ~ 10 Ma;
 - forming Mariana Basin; West Mariana Ridge
- Volcanism ceases permanently along "old fore-arc"

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Rifting occurs again ~ 10 Ma;
 - forming Mariana Basin; West Mariana Ridge
- Volcanism ceases permanently along “old fore-arc”
- Reefbuilding begins in earnest:
 - Tagpochau Limestone

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Spreading/uplifting continues

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Spreading/uplifting continues
- New Volcanic axis forms ~3-4 Ma
- Sea levels change

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Major reef building continues:
 - Tagpochau Limestone
 - 10 Mya - 1.6 Mya
 - Mariana Limestone
 - 1.6 Mya -

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

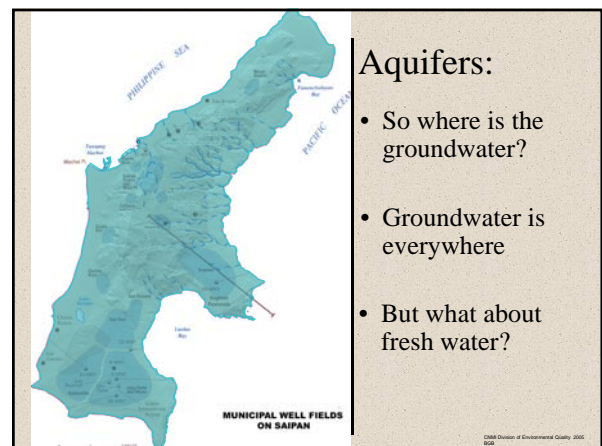

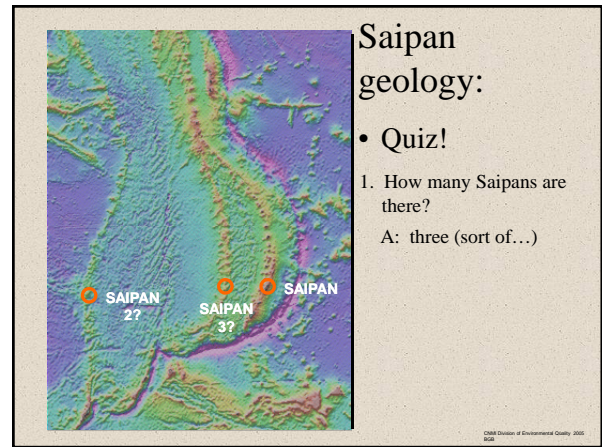

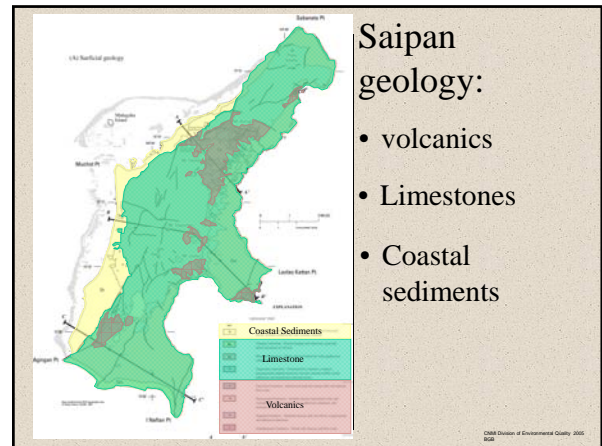

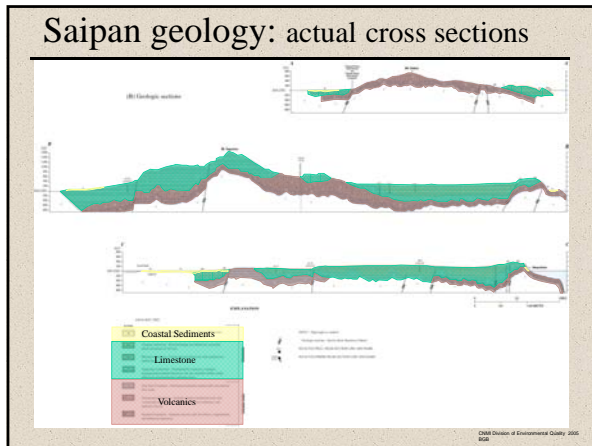

- Major reef building continues:
 - Tagpochau Limestone
 - 10 Mya - 1.6 Mya
 - Mariana Limestone
 - 1.6 Mya -
- Sea levels fluctuate (ice ages)
- New volcanic axis grows; Northern Islands emerge
- Modern reefs; coastal sediments form

DMR Division of Environmental Quality 2005 8/22

Saipan geology:

- Saipan takes on its present form
- Simplifying again:
 - Volcanics
 - Limestones
 - Coastal sediments

DMR Division of Environmental Quality 2005 8/22

Aquifers:

- Fresh water "Lens"
- Fresh water is lighter than salt water
 - "Ghyben-Herzberg relationship"
- 1:40 ratio:
For every 1 ft. "head" above sea level, 40 feet of fresh water below.

DMR Division of Environmental Quality, 2005, 8/02

Basal Lens:

- Isn't that nice?
- Reality check:

DMR Division of Environmental Quality, 2005, 8/02

Basal Lens:

- Anatomy of lens
- Theory: Depth of lens = depth to "mid point" of transition = 50% seawater

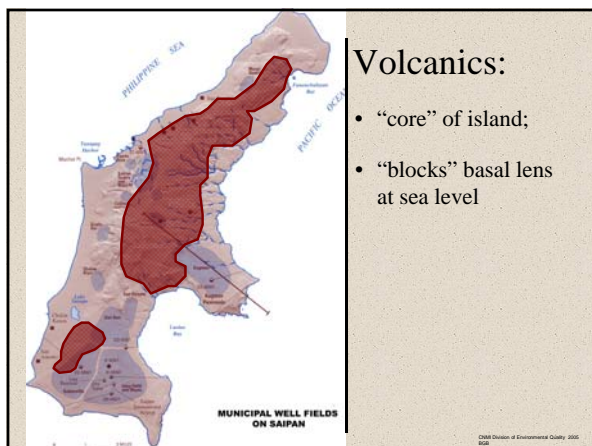

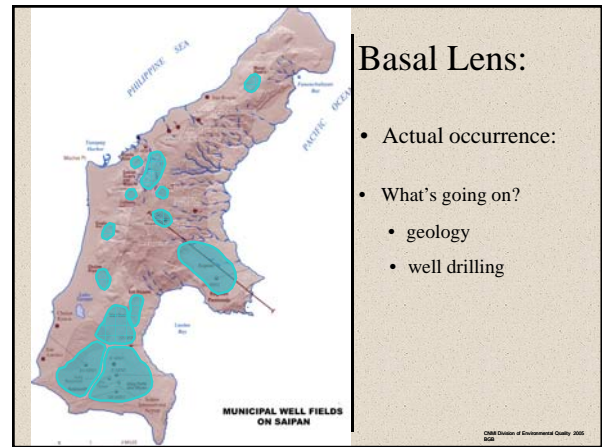

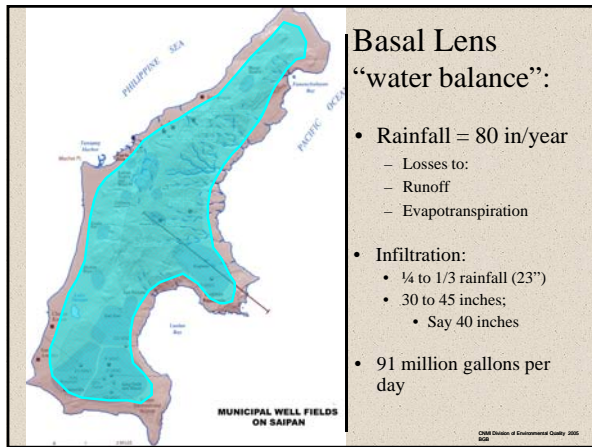

DMR Division of Environmental Quality, 2005, 8/02

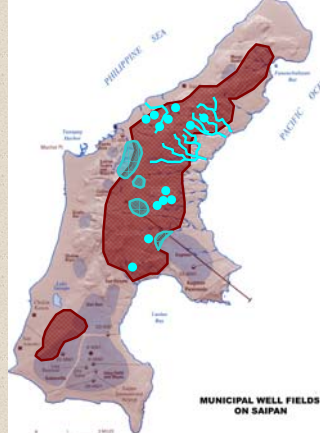

Basal Lens:

- Anatomy of lens
- Theory: Depth of lens = depth to "mid point" of transition = 50% seawater
- Reality: "potable" lens much thinner; transition more rapid

DMR Division of Environmental Quality, 2005, 8/02

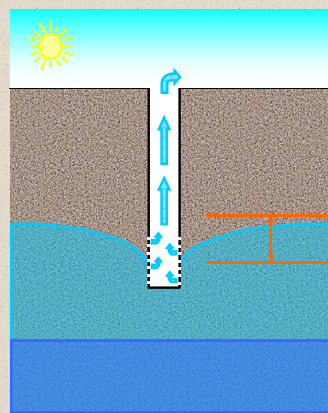

High level water:

- Perched aquifers
- Para-basal aquifers
- Springs
- Streams

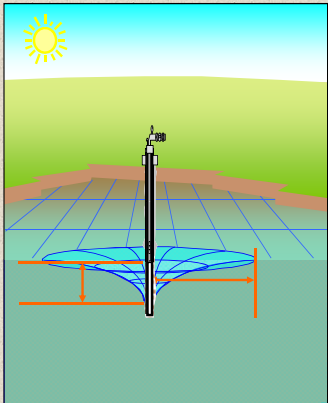

MUNICIPAL WELL FIELDS ON SAIPAN

DMR Division of Environmental Quality 2005 R02

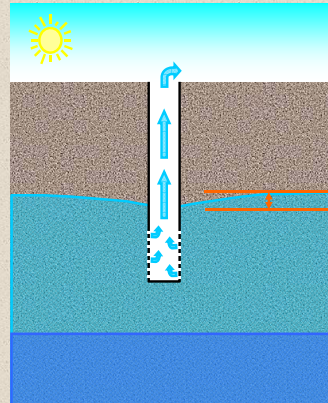

Water Wells:

- How much can you pump?
- **“Drawdown”**
- Cone of Depression
- A function of permeability and pump rate

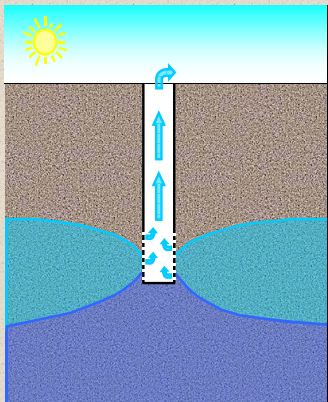

Water Wells:

- “Radius of Influence” = radius of cone of depression
- A function of permeability and pump rate

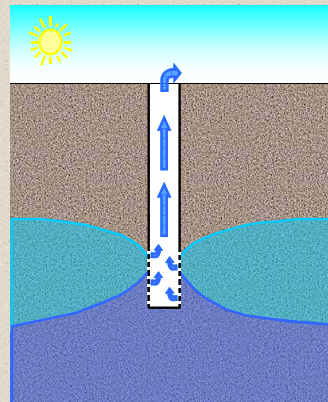

Water Wells:

- Example: **LIMESTONE**
- **Very small drawdown**
- Can pump 100s of gallons per minute!
- So why are most wells pumped only 10 gpm?

Water Wells:

- “Upconing”
- or:
- Salt water intrusion
- A function of **lens thickness, well depth, permeability, and pump rate**

Well Depth:

- Too close to transition depth:
- Production rate will always be limited

DMR Division of Environmental Quality 2005 R02

Well Depth:

- In transition zone:
- Never had a chance!

DMR Division of Environmental Quality, 2005
9/22

Well Depth:

- Ideal:
 - Shallow penetration “skims” fresh water from surface
- Production can be maximized
 - Still limited by aquifer/recharge characteristics

DMR Division of Environmental Quality, 2005
9/22

Wells:

- Where can a “good” well be drilled?

DMR Division of Environmental Quality, 2005
9/22

Wells:

- How much water can actually be produced?
- Theory:
 - 91 million gallons per day ?
- Actual withdrawal:
 - 13.6 mgd from CUC; wells & springs
- Needed:
 - 11 mgd

DMR Division of Environmental Quality, 2005
9/22
