W & T INTERNATIONAL

Consumer Confidence Report for 2014

W & T International CCR 2014

The Consumer Confidence Report (CCR) 2014 is the summary of the quality of water provided by W & T INTERNATIONAL for 2014. This contains relevant information on the water source, the levels of contaminants detected, and compliance with drinking water rules, as well as additional educational material. This CCR is prepared to: 1) inform the consumer of the quality of water, 2) help them better understand the significance of safe drinking water, and 3) encourage them to protect their drinking water sources.

Ang ulat na ito ay naglalahad ng mahalagang impormasyon tungkol sa inyong iniinom na tubig. Mangyaring ipasalin ito, o talakayin ito sa sinumang nakakaunawa.

이 안내는 매우 중요합니다.

W & T INTERNATIONAL is an apartment rental located in San Vicente. Also known as Hilltop condominium owned by Tan Holdings Corporation.

Our condominium consist of 18 units apartment for rent and boasts of a swimming pool and a panoramic view of some part of Saipan. Classified as a Public Water System (PWS), we are required to submit water samples for microbiological and chemical analysis based on the CNMI Drinking Water Regulations. These tests are done

in order to determine the presence of contaminants and take treatment techniques where applicable, and to ensure that drinking water reaches the consumer in safe and acceptable quality.

PUBLIC WATER SYSTEM INFORMATION

PWS NAME:	W & T INT'L / HILLTOP CONDOMINIUM
PWS #:	MP 0000115
ADDRESS:	PMB 521 PPP BOX 10000, SAIPAN MP 96950
CONTACT PERSON:	PUY MACARIO
CONTACT NUMBER:	(670) 235-6527
FAX NUMBER:	(670) 235-6530

WATER SOURCE INFORMATION

Hilltop Condominium or W & T Int'l obtains water from own deep well in San Vicente. The well, with permit # WOP-006rw, pumps approximately 25 gallons of water per minute. Well water is stored in a concrete 10,000 Gallon water tank. Water is disinfected continuously thru automatic chlorine feeder installed at the pump room before reaching the main

water tank.

KEY TERMS AND DEFINITIONS:

Maximum Contaminant Level (MCL)

- the highest level of contaminant that is allowed in drinking water. MCL's are as set as close to the MCLG's as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG)

- the level of a contaminant in drinking water below which there is no known or expected risk to health. This level allows margin of safety.

Maximum Residual Disinfectant Level (MRDL)

- the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG)

- the level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control

microbial contaminants.

Action Level (AL)

-the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

None Detected (ND)

- means detected value is below reporting level.

Total Coliform

- Coliforms are a family of bacteria, naturally present in the environment. They are used as indicator organisms. Their presence indicates that other potentially harmful bacteria may be present such as *E.coli*. This would indicate fecal contamination in water. When coliforms are detected more than the allowed limit, it is a warning or an indication of potential problems. Samples that turn out positive are required to be collected for four repeat samples within 24 hrs, and five routine samples the following month.

Treatment Technique

-a required process intended to reduce the level of a contaminant in drinking water.

HEALTH INFORMATION ON CHEMICAL CONTAMINANTS

W & T Int'l/Hilltop Condominium is required to monitor for Phase II/V (Inorganic & Organic Contaminants) Lead & Copper (Pb & Cu) and Total

Trihalomethane & Haloacetic acids (TTHM & HAA5) once every three years. Samples are required to be collected from designated and approved sampling sites. Nitrate/Nitrite (NO₃) at Entry Point is required annually.

Nitrate is usually obtained from leaching septic tanks, sewage, run-off from fertilizer use and erosion of natural deposits. Infants below the age of six months who drink water containing nitrate or nitrite in excess of the MCL could be-

come seriously ill, and if left untreated, may die. Symptoms may include shortness of breath and blue-baby syndrome.

Lead and copper are regulated in a Treatment Technique which requires systems to take tap water samples at sites with lead or copper pipes that have lead solder or are served by lead service lines.

Copper is an essential nutrient, but some people who drink water containing copper in excess of the action level over a relatively short amount of time could experience gastrointestinal diseases. Some people who drink water containing copper in excess of the action level over many years could suffer kidney or liver damage. People with Wilson's Disease should consult their personal doctor.

(Continued on page 3)

Lead present in water in excess of the action level could delay the physical and mental development of infants and children and could show slight deficit in attention span and learning disabilities. So far, they did not exceed the action level set by the Environmental Protection Agency (EPA).

The Stage 1 DDBPR requires systems which use chemical disinfections procedures to collect samples from sites with the maximum residence time during the warmest months of the year. One sample was collected in 2004 to check for the presence of Trihalomethane (THM) and Haloacetic acid (HAA). Some people who drink water containing HAA's in excess of the MCL over many years may have an increased risk of getting cancer while some who drink water containing THM's in excess of the MCL over many years may experience problems with their liver, kidneys or central nervous systems, and may have an increased risk of getting cancer.

Table 1 on page 4 shows the result of Chemical Contaminants.

ADDITIONAL INFORMATION ON WATER CONTAMINANTS

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA / CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA / CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants**, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides**, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- **Radioactive contaminants**, which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits from contaminants in bottled water that must provide the same protection for public health. These same regulations also apply to local bottled water companies considered community public water systems in the CNMI.

VIOLATIONS FOR THE YEAR 2014

W & T International / Hilltop Condominium completed all the required monthly Total Coliform testing requirements for 2014 and obtained no MCL violation. We collected Nitrate sample on October 8, 2014 at the Entry Point (11502). We also did the requirements for Total Trihalomethanes & Haloacetic Acids (TTHM & HAA5 or DBP) collected on November 10, 2014 at Unit 101 kitchen sink (11505). Results for these contaminants show that no MCL was detected (see table 1 below).

Table 1. 2014 Contaminants Detected from W & T International.

CONTAMINANTS	Maximum Con- taminant Level		Detected Levels	Was there a violation?		Probable Sources of Contaminants
	Goal	Allowed		Yes	No	
Inorganic Contaminants collected on October 8, 2014						
Nitrate (ppm)	10	10	6.0		X	Runoff from fertilizer use; Leaching from sep- tic tanks, sewage; Erosion of natural deposits
Volatile Organic Contaminants collected on November 10, 2014						
Total Trihalomethane (ppb)	N/A	100/80	10		X	By-products of drinking water chlorination
D/DBP Haloacetic Acids (ppb)	N/A	60	2.7		X	By-products of drinking water chlorination

UNITS:

ppb—parts per billion
ppm—parts per million

KEYS:

N/A—Not Applicable (MCLG's were not established before the 1986 Amendments to the Safe Drinking Water Act. Therefore there is no MCLG for this contaminant).

This CCR 2014 is available at W&T International Office located in Finasisu Terrace Apartment. For questions, comments and suggestions please feel free to call W&T International at 235-6527.
